STIC-Biotech/ChemLib

Subject:

Sequence search 09/851410

Please translate & search AA encoded by:
nt 5147-7129 of SEQ 6
nt 5117-7096 of SEQ 10
And search SEQ 8.
Please do regular search, oligo search for the seq 6 & 10 translation products, and interference search. Thanks.

```

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             GTCGAGACCTCTGGGGTGGCTGAGGAGGAGGCTACCTCTGGTCTTGTTATGCTTTGCATA 840
                                                                                         A method has been developed for detecting hepatitis E virus (HEV) antibodies (Ab). The method comprises: (a) reacting a serum sample with a HEV peptide antigen; and (b) examining the peptide for the presence of bound Ab, where the presence of bound Ab indicates the presence of HEV Ab. The present sequence encodes the protein from the open reading frame, ORP2, from HEV Burma strain. The method can be used to diagnose infection with the enterically transmitted non-A/non-B viral hepatitis agent HEV, specifically the HEV Burma and Mexico strains. (Updated on 25-MAR-2003 to correct PF field.) (Updated on 17-OCT-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The hepatitis E virus (HEV) Burma strain ORF-2 (AAI27107) codes for the putative capsid protein (AAR96089). PCR amplification of ORF-2 allows produ. of capsid protein or of C-terminal regions of the capsid protein (see also AAR96091, AAR96093) and AAR96095) and expression in Spodoptera frugiperda SF9 insect cells using a baculovirus vector provides recombinant C-terminal regions (see also AAR96101 and AAR96103) useful as diagnostic reagents and in vaccines. The HEV Mexico strain ORF-2 (AAI27108) may similarly be used. (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      120

Immunogenic hepatitis B virus (HEV) peptides are selected from the ORF1, ORF2 and ORF3 regions of HEV. The peptides can be used in vaccines to prevent infection by HEV. The antibodies can neutralise and block HEV infection and can be used to prevent or treat HEV infection. The peptides and antibodies can also be used as diagnostic reagents. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 24-OCT-2003 to standardise OS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            TICTGGGGTGACCGGGTTGATICTCAGCCCTTCGCAATCCCCTATATTCATCCAACCAAC 180

                                                                                                                                                                                                                                                                               The sequence is that encoding Burma strain hepatitis E virus (HEV) open reading frames ORF2 and ORF3. ORF2 encodes the putative capsid protein of the virus, this protein or peptide fragments of it may be used in a vaccine composition for immunishing an individual against HEV. Antibodies raised against these peptides can also be used in such vaccines. (Updated on 25-MAR-2003 to correct PN field.)

The present sequence represents the genome of the Burma strain of enterically transmitted non A non B hepatitis virus (ET-NANB) (hepatitis virus (HEV)). The specification describes an isolated protein which is specifically immunoractive with antibodies present in individual is infected with HEV and encoded by a sequence contained in an open reading frame (ORF) of an HEV genome. The genome has a sequence that is more than 70% identical to the ORF) sequence from Burma HEV isolate. The protein is used as a vaccine and a diagnostic probe for ET-NANB. (Updated on 25-MAR-2003 to correct OR field.)

Enterically transmitted nonA/nonB hepatitis virus; identification; HEV; ET-NANB; detection; vaccine; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents the sequence of the Burmese isolate of enterically transmitted nonA/nonB viral hepatitis agent (ET-NANB). The nucleic acid sequence may be used for identifying and sequencing the entire viral agent (also referred to as HEV), detecting ET-NANB in infected samples, e.g. by specific amplification of virus-derived DNA sequences and for producing recombinant viral proteins for use in vaccines. (Updated on 25-MAR-2003 to correct PF field.)

                                                                                                                                                                                                                   à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a method for identifying a recombinant antigen immunoreactive with a hepatitis E virus (HEV)-induced antibody. The method comprises producing a polypeptide derived from an HEV genome, immunoreacting the polypeptide with an HEV-positive antiserum and selecting the polypeptide as a recombinant antigen if the polypeptide as a recombinant antigen if the polypeptide dentiserum. The method is useful for identifying recombinant antigen immunoreactive with antibody induced by HEV. The enterically transmitted non-A/non-B hepatitis (ET-NANB (also known as HEV).) -specific fragments are useful for identifying ET-NANB. Or detecting ET-NANB virit contain additional sequence information, as primers for detecting ET-NANB virits genome acquence information, as primers for detecting ET-NANB virits genome acquence information, as primers for detecting ET-NANB virits and for identifying similar antigens are especially useful in the preparation of vaccine against ET-NANB virus particles for used to prepare antigens and to produce antiserum designed for pre- or post-exposure agents, and to produce antiserum designed for pre- or post-exposure prophylaxis. The present sequence represents a specifically claimed HEV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               β
                                                                                                                                                                                                                                                                                                                                                                                                                                       Reyes GR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Identifying recombinant antigen immunoreactive with antibody induced hepatitis E virus (HEV), for detecting HEV infection, comprises immunoreacting a polypeptide from an HBV genome with an HEV-positive

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  5326
                                                                                                                                 The invention relates to an isolated DNA comprising the genome of an enterically transmitted nonA/nonB (ET-NANB) viral hepatitis agent (also referred as HEV). The DNA sequences or their fragments are useful in preparing ET-NANB viral proteins and as probes for virus detection. These are particularly useful in diagnosing infection by an enterically transmitted agent (e.g. ET-NANB virus), as well as in vaccine production. The present sequence represents a ET-NANB viral DNA sequence from HEV-Burma strain
                                                                                                                                                                                                                                                                                                                                                                                                                                         0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              120
New DNA sequences of enterically transmitted non-A/non-B (ET-NANB) hepatitis viral agent, useful in diagnosing infection by an enterically transmitted agent (e.g. ET-NANB virus), as well as in vaccine production.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      5446
                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention comprises a method for detecting the presence of enterically transmitted nonA/nonB hepatitis viral (HEV) agents in a sample and isolating HEV agents or nucleic acid fragments produced by the agent. The method utilises PCR - using bile from a human or cynomolgus monkey actively infected with HEV as a source of the agent. The method of the invention is used for detecting the presence of a viral agent in a sample of cultured cells infected with the agent and isolating enterically transmitted nonA/nonB HEV agents or nucleic acid fragments produced by the agent. The present DNA sequence was isolated from a Burmese strain of the Hepatitis E virus, the present DNA sequence has three open reading frames ORF1, ORF2 and ORF3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               5626
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     5686
                                                                                                                                                                                            The invention relates to a protein derived from an enterically transmitted non-A/non-B viral heparitis agent. The viral proteins are useful for detecting infection by the enterically transmitted non-A/non-B viral agent. The proteins are also useful for producing vaccines for immunising an individual against HEV heparitis viral agent. The DNA fragments are useful for identifying and sequencing the entire viral agent and for assaying the viral agent in an infected sample. The present sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              180
